By default, the Tool downloads and runs an NI FPGA compiler on the current computer. The Tool also supports the following NI FPGA Compiler features: Deep cycle detection (see the Compiler for more information on what this means) Code optimization (removes redundant code and variables, if possible) Code folding (shuffles the FPGA compilations code to support multiple versions of LabVIEW and the NI FPGA Compiler) Run NI FPGA Compilation on your computer with/without a remote server Pre-built NI FPGA Compiler packages are provided as Windows binaries. If you would like to use a remote server to compile NI FPGA code on your computer, use the optional GUI client to control the remote server. NI FPGA Compiler Application (and GUI client) The NI FPGA Compiler Application (and GUI client) provides the capability to compile NI FPGA code on a remote server and on your computer. 1. Install the NI FPGA Compiler App The NI FPGA Compiler App can be installed on one or more computers. In order to use the NI FPGA Compiler App, you will need to download a version of the NI FPGA Compiler. 2. Install the NI FPGA Compiler GUI Client The NI FPGA Compiler GUI Client is a graphical user interface (GUI) client that supports the installation and usage of the NI FPGA Compiler application. The NI FPGA Compiler GUI Client can be downloaded and installed separately from the NI FPGA Compiler Application. The NI FPGA Compiler GUI Client can be used to install and manage the NI FPGA Compiler on a server computer, or can be used on a single computer to remotely compile and run NI FPGA code on your computer. When working on your computer, the NI FPGA Compiler GUI Client allows you to manage the NI FPGA Compiler from a single location. It is recommended that the NI FPGA Compiler GUI Client be installed and run on the same computer that will be compiling NI FPGA code. Using the NI FPGA Compiler GUI Client on a separate computer can result in a lack of feedback as to the progress 82157476af
